

**KCP, KCPv  
KCPL, KCPLv**  
**PUMPE VISOKOG PRITISKA**  
*CONDESATE CENTRIFUGAL PUMPS*

# KCP, KCPv, KCPL, KCPLv

## PRIMENA

Pumpe tip KCP i KCPv mogu, osim čiste vode, transportovati i nečistu vodu. Pogodne su za teže uslove usisa kao kod kondenzata većih usisnih visina, otpora u usisnom cevovodu i sl. Mogu transportovati fluid do 80 °C.

Pumpe tip KCPv imaju ugrađenu komoru za hlađenje pletenice, pa se primenjuju za transport fluida do 105 °C.

Pumpe tip KCPL i KCPLv namenjene su uglavnom za transport kondenzata kako čiste tako i nečiste vode. Pumpe tip KCPLv imaju mogućnost hlađenja pletenice pa mogu transportovati fluid do 130 °C.

Odgovarajuće su za teže uslove usisa. Zbog vertikalne izvedbe odlikuju se sigurnošću u radu, a za ugradnju je potrebno manje prostora.

## KARAKTERISTIKE

Pumpe tip KCP i KCPv

Broj obrtaja: 1450 min<sup>-1</sup>

Kapacitet (protok): 5÷120 l/s

Visina dizanja: 35÷330 m

Temperatura: do 105 °C

Zaptivanje: pletenica ili mehanička zaptivka

Pumpe tip KCPL i KCPLv

Broj obrtaja: 1450 min<sup>-1</sup>

Kapacitet (protok): 2,5÷130 l/s

Visina dizanja: 8÷380 m

Temperatura: do 130 °C

Zaptivanje: pletenica ili mehanička zaptivka

## OPIS IZVOĐENJA

### KUĆIŠTE

Pumpe su sekcionalog tipa tj. svako statorsko kolo ugrađeno je u svoje sekciono kućište (međukućište) i zajedno sa radnim kolom, smeštenim na vratilu, čini jedan stepen. Potreban broj stepeni, zajedno sa usisnim i potisnim kućištem, spregnuti su pomoću zajedničkih steznih vijaka.

Kod KCPL pumpi čitava pumpa je smeštena u loncu zavarene izvedbe sa konstantnim dotokom fluida. Visina lonca je definisana zahtevom projekta.

### RADNA I STATORSKA KOLA

Radna kola su jednostrujna sa dvostrukim procepnim prstenovima. Na radnim kolima urađeni su otvorovi koji služe za izjednačavanje sila u aksijalnom pravcu. Procepni prstenovi, ugrađeni u kućištima, su zamenljivi. Statorska kola su posebni delovi koji se mogu jednostavno montirati i demontirati.

### VRATILA I LEŽAJEVI

Vratila su uležištena u dva uljem podmazivana kuglična ležaja kojima je dodat i jedan aksijalni ležaj. Ovaj ležaj preuzima ostatak aksijalnih sila koje mogu nastati zbog nedovoljne izjednačenosti sila u pumpi i nejednakog trošenja procepnih prstenova. Ležajevi su podmazivani uljem ili mašću, a kod visokih temperatura (KCPv pumpe) u kućišta ležajeva ugrađuju se hladnjaci ulja sa zasebnim dovodom i odvodom hladne vode.

Vratilo kod KCPL pumpi je uležišteno u jednom ili više kliznih radijalnih ležajeva podmazivanih vodom i jednim kotrljajućim ležajem, koji prenosi aksijalnu силу. U slučaju nečiste vode, klizni ležajevi se podmazuju mašću, posebnom pumpom za mast. Vratilo je zaštićeno distantnim čaurama, tako da ne dolazi u dodir sa fluidom koji pumpa transportuje.

### ZAPTIVNA PLETENICA

Sa obe strane pumpe omogućen je pristup pletenicama. U slučaju podprtisika u usisnom kućištu, zaptivna voda se priključuje na prvi stepen pumpe. Na specijalan zahtev, umesto zaptivnih pletenica moguće je ugraditi mehaničku zaptivku.

### MATERIJALI

U standardnoj izvedbi, kućišta, radna kola i statorska kola se izrađuju od sivog liva. Procepni prstenovi, distantne i zaštitne čaure izrađuju se od bronce, a vratila od ugljeničnog čelika. Na zahtev kupca, delovi pumpi mogu biti izrađeni i od drugih materijala.

### POLOŽAJ PRIRUBNICA

Položaj usisne i potisne prirubnice može biti vertikalno gore ili horizontalno levo, odnosno desno, nezavisno jedna od druge. Na poseban zahtev, pumpe mogu biti izrađene sa položajem prirubnica vertikalno dole. Položaj prirubnica definiše se gledano od pogonske strane pumpe tj. od strane spojnica. Šematski prikaz položaja prirubnica dat je ispod merne skice pumpe.

Kod KCPL pumpi usisna i potisna prirubnica su iznad poda postrojenja u istoj osi pod uglom od 180°.

Na zahtev kupca isporučujemo ove pumpe i sa drugim položajem prirubnica.

### AGREGATIRANJE

Na zahtev kupca pumpe se isporučuju sa pogonskim mašinama: elektromotorima, dizel i benzinskim motorima, parnim turbinama i dr. Temeljna postolja su jednodelna ili dvodelna, mogu biti livena ili zavarena iz čeličnih profila. Uz pumpe može biti isporučena i armatura.

### PORUDŽBINA PUMPE

Kod poručivanja, preporučuje se navesti sledeće: vrstu fluida (slatka ili morska voda, PH vrednost, hemijski sastav, agresivnost, stepen nečistoće i sl.), protok, visinu dizanja, NPSH postrojenja ili potrebnu usisnu visinu, pritisak na ulazu u pumpu, temperaturu medija, položaj prirubnica.

Kod KCPL pumpi navesti kolika je potrebna kota "L".

## USES

Pumps type KCP and KCPv can, beside the clean water, transport impure water as well. Suitable for more difficult suction conditions such as condensates of major geodetic suction heights, resistance in the suction pipeline, etc. Transportable fluids to temperature up to 80°C.

Pumps type KCPl have a cooling chamber packing incorporated, and are used for the transport of hot water up to 105°C.

Pumps type KCPL and KCPLv are intended mainly for the transport of condensate, both clean and impure water. Pumps type KCPLv have the ability to cool the packing so they can transport fluid up to 130°C.

They are suitable for more difficult suction conditions. Due to the vertical design, they are characterized by safety in operation, and less space is required for installation.

## FEATURES

Pumps types KCP and KCPv

Speed: 1450 r.p.m

Capacity: 5÷120 l/s

Total head: 35÷330 m

Temperature: up to 105°C

Sealing: packing or by mechanical seal

Pumps types KCPL and KCPLv

Speed: 1450 r.p.m

Capacity: 2,5÷130 l/s

Total head: 8÷380 m

Temperature: up to 130°C

Sealing: packing or by mechanical seal

## PERFORMANCE

### CASING

The pumps are of a sectional design, thus having each diffuser built into the sectional interstage casing, which comprehensively, with and impeller, being affixed on the shaft, forms one stage. Adequate number of stages, together with a suction and delivery casing, are tightened over joint tightening bolts.

At KCPL pumps, the entire pump is located in a welded tank with a constant fluid supply. The height of the tank is defined by the project requirement.

### IMPELLERS AND DIFFUSERS

Impellers are of the single-suction design with double wear rings. Holes made on the impellers are used for equalizing thrusts in the axial direction. Wear rings, installed in casings, are replaceable. Diffusers are separate very easy mantling and dismantling parts.

### SHAFTS AND BEARINGS

Shafts are placed in the two oil lubricated roller bearings to which an axial bearing has been added.

This bearing absorbs the rest of the axial thrusts which may arise due to lack of the tie thrusts in the pump and of uneven use of wear rings. The bearings are lubricated with oil or grease, and at high temperature (KCPv pumps) in the bearing bracket are installed oil coolers with a separate supply of cold water.

### PACKING

Access to packing is provided on both sides. Should subpressure in a suction casing occur, sealing water is to be connected to the first pump stage. Mechanical seals with slide rings can be fitted instead of packings, upon customer's requirements.

### MATERIALS

In the standard version, the casing, impellers and diffusers are made of cast iron. Wear rings, spaced and protective sleeve are made of bronze, and shaft of carbon steel. At the customer's request, pump components may be also made from other materials.

### POSITION OF THE FLANGES

Position of a suction and delivery flanges can be directed vertically upwards, horizontally left or right, thus being independent of each other. Pumps having the flange position vertically downwards are made on a special requirement. Flange position is defined, taking a view from a pump driving side i.e. coupling side. Drawings of flange position is given below the drawing measure of pumps.

At KCPL pumps, the suction and discharge flanges are above the floor of the plant in the same axis at an angle of 180 °.

At the customer's request, we also deliver these pumps with a different flange position.

### INSTALLATION OF UNITS

On a customer's requirements, pumps are supplied with drive machines: electric motors, diesel and petrol engines, steam turbines and others. Base plates are one-piece or two-piece, can be cast or welded of steel. Pumps are also accompanied by adequate fittings.

### PUMP ORDER

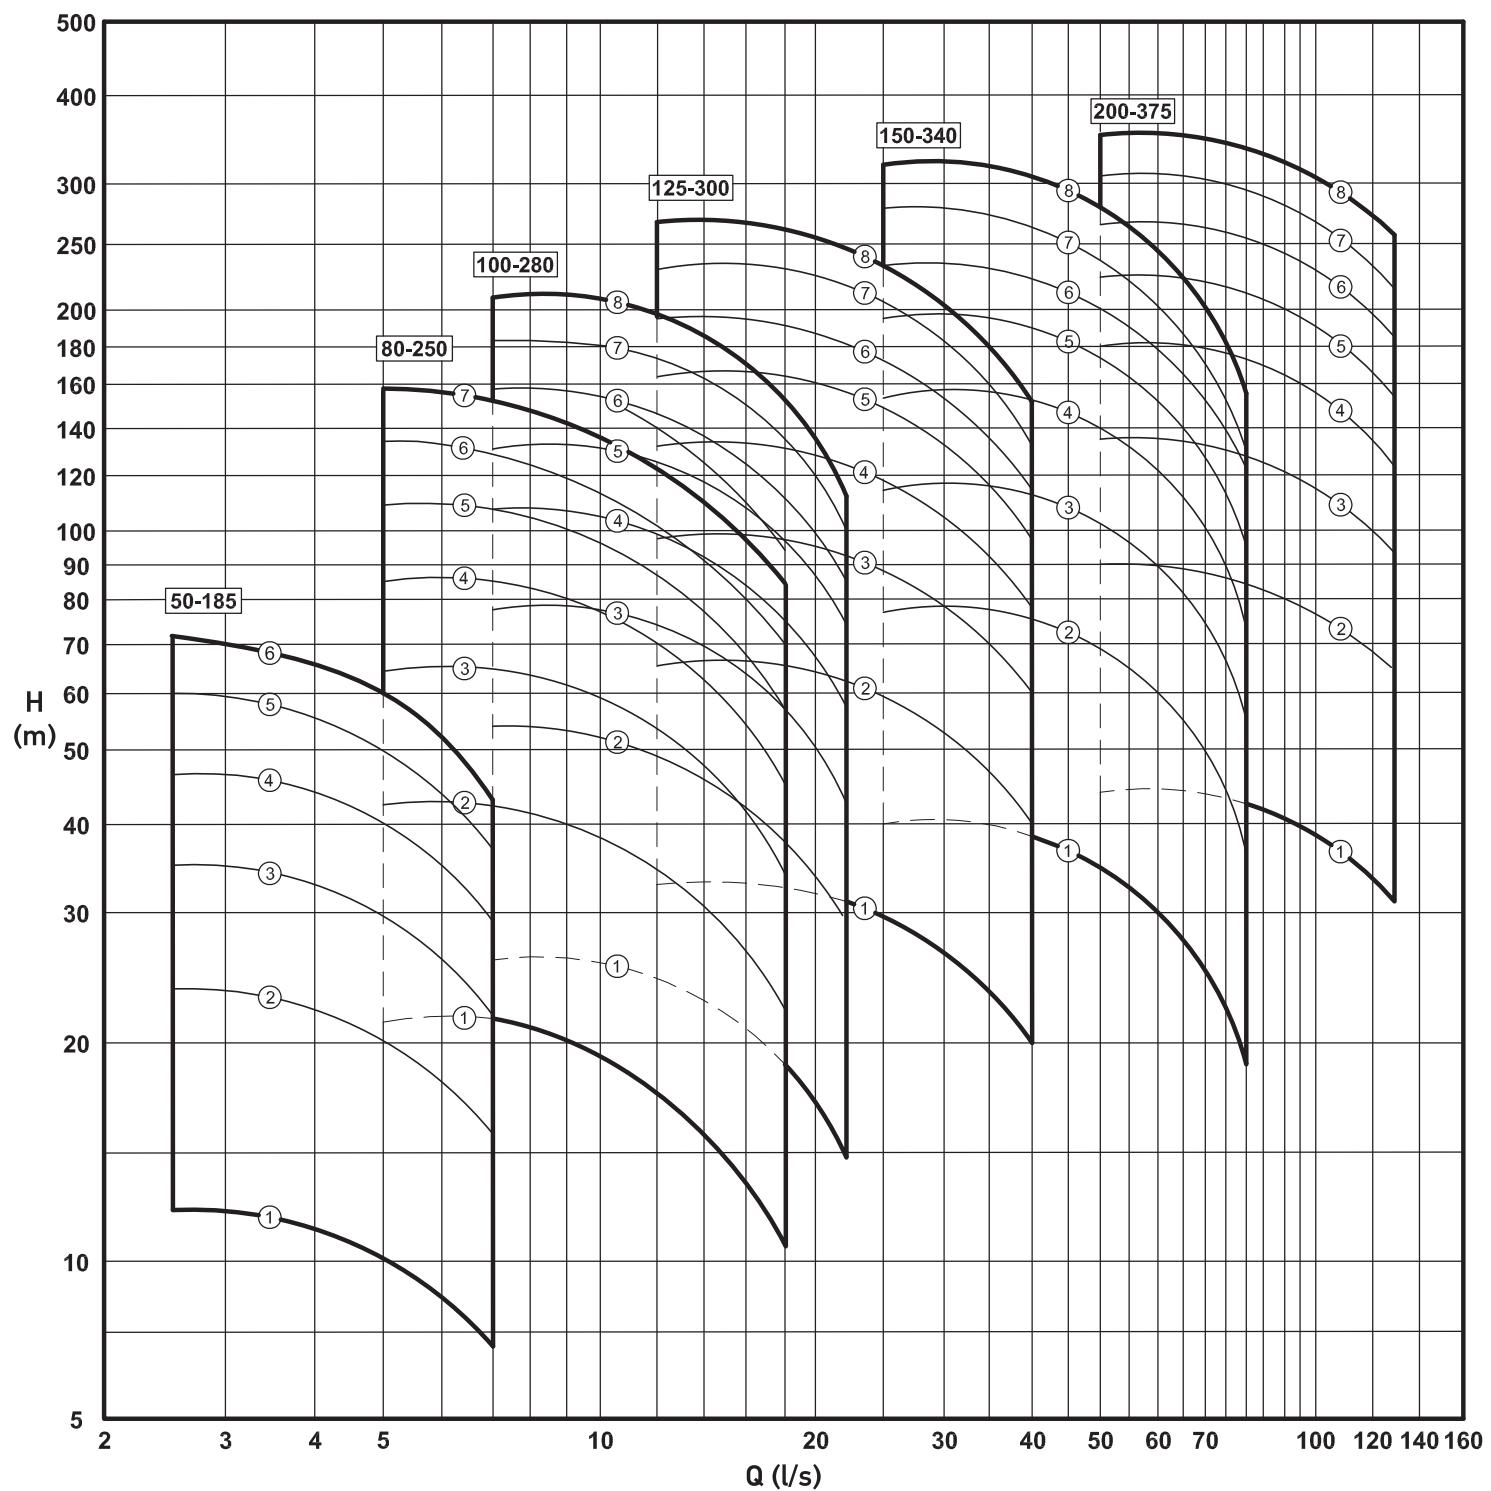

When ordering the pump it is recommended to indicate the following: the type of fluid (fresh or sea water, PH value, chemical composition, aggressiveness, the degree of impurities etc.), capacity, total head, NPSH plant or the necessary suction head, the pressure at the pump inlet, temperature of fluid, position of flanges.

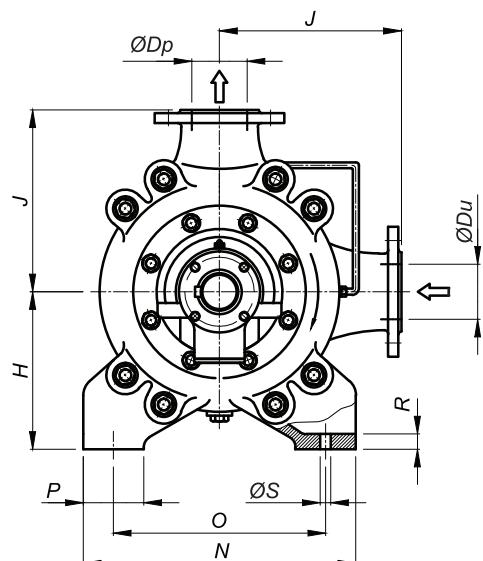

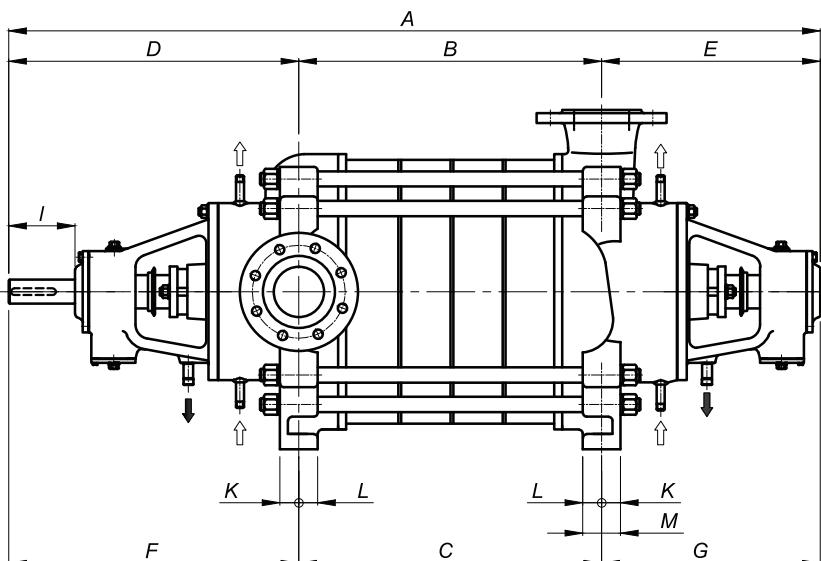

For KCPL pumps, specify the required length "L".
